## Diggity Designs 3D08 1/12th Kit

Contributed by REV Scale  
Saturday, 17 November 2007

Diggity Designs have released their latest 12th scale car kit 3D08. The 3D08 is based on their race proven 3D12 12th scale car kit. The main feature allows you to mount brushless ESC's on the side of the chassis and install brushless motors without any wire problems. You can now mount your electronics as far to the rear as possible. They have widened the rear outer springs location to help with mounting brushless motors and to improve performance and stability.

The 3D08's carbon fiber pieces are CNC milled using the best quality 2.5mm quasi carbon available to the market. Kits include performance proven CRC red anodized aluminum parts and Associated's race winning pro-strut front end kit. Holes are pre-drilled to allow the mounting of JR-3550, JR-3650, Hitec 225, KO-949, Futaba-9650, and Airtronics 94141 and 94145 servos.

Includes everything you will need minus servo saver, motor screws, body and tires since these change depending on the application and racer's choice. Parts are available in our Accessories and Spare parts pages.
